EDUCATION

University of California, Berkeley Expected Graduation: **December 2027**
Bachelor's Degree in Computer Science; Minor in Data Science
Relevant Coursework: Data Structures, Machine Structures, Computer Security, Computer Networking, Artificial Intelligence

EXPERIENCE

Multi-Agent Systems & Agentic Product Engineer Intern *October 2026 – Present*
PhysaFlow *San Francisco, CA (Remote)*

- Designed and built the base structure for three domain agents (facility, compute/IT, sustainability) in a Python 3.11 FastAPI service, shipped as my first PR and reviewed by the tech lead and an independent reviewer; agents only propose actions or decline with a reason code, and never write.
- Found a safety gap while testing: a snapshot with no observations could get approved on a separate decision path; wrote a test that proved it, reported it to the tech lead, and reverted that part, pinning the refusal with a test.
- Changed the agent-input builder so a missing, stale, or invalid input reaches the agent as an explicit labeled state instead of a hard failure, keeping the v1 contract unchanged; approved by the tech lead.
- Checked that the tests really catch failures by breaking code on purpose (three deliberate breaks made exactly the six predicted tests fail), and ran the full test suite in Docker as review evidence when CI was down.

Data Assistant *June 2026 – Present*
UC Berkeley, Visiting Scholar & Postdoc Affairs (VSPA) *Berkeley, CA*

- Debugged and wrote Python scripts for data validation and cleaning, standardizing 3,000+ monthly entries from departments and funding agencies.
- Produce monthly appointment and reappointment summaries from the validated data, giving the Vice Chancellor's office audit-ready statistics across 90+ departments and 3 scholar types each quarter.

Core 38, 39 Vice President of External Relations *May 2025 – Present*
Pilipinx Association of Scientists, Architects & Engineers (PASAE) *Berkeley, CA*

- Led semester recruitment pipeline (tabling, info sessions, kickoffs) and co-organized UC Berkeley career fairs hosting 90+ employers and 2,000+ students; secured speakers and sponsors for flagship events.
- Managed and mentored External Reps and interns; ran weekly standups, scoped workstreams, created onboarding playbooks, and served as a career resource for 60+ active members.

PROJECTS

Posting Triage Tool (Python, Claude API, FastAPI, Docker, AWS) | *github.com/jar-narvz/posting-triage* *Fall 2026*

- Built a CLI and REST API that triages job postings into APPLY, FLAG, SKIP, or DEAD with a reason quoted from the posting: Claude extracts eligibility fields with an exact quote each, code verifies every quote is in the text, and deterministic rules decide.
- Deployed one Docker image for the CLI and API to AWS Lambda (ECR, Parameter Store secrets, CloudWatch, least-privilege IAM) with a one-command deploy script, and cut the image's vulnerability scan from 337 findings to 0.
- Secured the API with bearer-token auth, per-token rate limiting, and SSRF protection that routes headless Chromium (Playwright) through a filtering proxy, blocking private and cloud-metadata addresses.
- Designed an eval on 200 synthetic postings with known answers, comparing a keyword baseline, a direct LLM-decides prompt, and the pipeline on 3 Claude models: the pipeline hit 100% accuracy on all 3 (keywords 56%), and Haiku matched Opus at 1/20 the cost.

Secure File Storage & Sharing System (Go) | *Course Project* *Fall 2025*

- Designed and built a secure cloud file storage system in Go, using Argon2 key derivation, AES-CTR encryption, and HMAC-based integrity verification to protect user credentials and file contents against malicious server operators and unauthorized access.
- Engineered an append-efficient linked-list storage architecture with per-chunk encryption, achieving O(new data) bandwidth on appends; file keys distributed via RSA public-key encryption and authenticated with digital signatures.
- Implemented invitation-based file sharing with transitive access and secure revocation, re-encrypting content under fresh keys and recursively propagating updates across a sharing tree; supported multi-device sessions with a fully stateless client.

SKILLS

Languages: Python, Go, Java, C, SQL, JavaScript, HTML/CSS
Frameworks & Tools: FastAPI, Docker, AWS Lambda, Playwright, pytest, GitHub Actions (CI), Git/GitHub, React, NumPy, Pandas
Concepts: Multi-Agent Systems, Agent Evaluation, LLMs, Prompt Engineering, REST APIs, Software Testing, Cryptography, Networking (TCP/IP)
